

STUDENT DETAILS

Name: Job Roman Barasa

Admission Number: BSCCS/2024/42922

Course: Bachelor of Science in Computer Science

Unit Code: BIT 4138

Unit Name: Advanced Cryptography

Lecturer Name: Mr Michael Nyoro

Academic Year: 4.2

PROJECT DETAILS

Project Title: Course Work Advanced Cryptography

Creative Tasks Done

Encrypted and decrypted words using Vigenere and Caesar Cipher

Created random number generators

Modified an already existing XOR cipher

Additional assignments week 1 to 3

Selected Technologies

Python

Python libraries

Week 1: Cryptography Environment Setup

Installation and Configuration of Cryptography Development Environment

A terminal window with a dark purple background. The prompt is 'ayub@ayub-HP-EliteBook-820-G3: ~'. The user enters 'python3 --version' and the output is 'Python 3.12.3'. Then the user enters 'code --version' and the output is '1.117.0', followed by a long alphanumeric string '10c8e557c8b9f9ed0a87f61f1c9a44bde731c409' and 'x64'. The prompt returns to 'ayub@ayub-HP-EliteBook-820-G3:~\$' with a cursor.

```
ayub@ayub-HP-EliteBook-820-G3:~$ python3 --version
Python 3.12.3
ayub@ayub-HP-EliteBook-820-G3:~$ code --version
1.117.0
10c8e557c8b9f9ed0a87f61f1c9a44bde731c409
x64
ayub@ayub-HP-EliteBook-820-G3:~$
```

Figure 1: Installation of Python and VS Code

A terminal window with a dark purple background. The prompt is 'ayub@ayub-HP-EliteBook-820-G3:~\$'. The user enters 'python3 -m venv crypto-env'. Then 'source crypto-env/bin/activate'. Then '(crypto-env) ayub@ayub-HP-EliteBook-820-G3:~\$ pip install cryptography'. The output shows the process of collecting and downloading packages: cryptography, cffi, and pycparser, with progress bars and download speeds. It ends with 'Successfully installed cffi-2.0.0 cryptography-48.0.0 pycparser-3.0'.

```
ayub@ayub-HP-EliteBook-820-G3:~$ python3 -m venv crypto-env
ayub@ayub-HP-EliteBook-820-G3:~$ source crypto-env/bin/activate
(crypto-env) ayub@ayub-HP-EliteBook-820-G3:~$ pip install cryptography

Figure 5: GitHub Repository Initialization

Reflection

I learned how to set up a Python cryptography environment, configure OpenSSL and Git, and execute encryption scripts. The main challenge was resolving the pip installation restriction in Ubuntu. The screenshots demonstrate successful installation, configuration of security tools, encryption testing, and project repository initialization.

Figure 7: Encrypt "NETWORK" using Vigenère Cipher using keyword "KEY".

Class Activity 2: Cipher Comparison Table

	Caesar Cipher	Vigenere Cipher
Encryption Method	Substitutes each letter by shifting it a fixed number of positions in the alphabet.	Multiple Caesar shifts based on a keyword.
Key Usage	A single numerical shift value ie. 4	A keyword that determines different shifts for different letters.
Security Level	Easy to crack using brute force or frequency analysis.	Higher security than Caesar Cipher as it uses multiple shifts.
Advantages	Simple to understand and implement	More secure than Caesar Cipher

	Caesar Cipher	Vigenere Cipher
	Requires little computation	Harder to break without knowing the keyword.
Weaknesses	Very easy to decrypt due to only 25 possible shifts.	Vulnerable to cryptanalysis if the keyword is short or repeated.
Ease Of Implementation	Very easy, can be done manually with minimal effort.	Moderately easy. Requires matching the keyword with the plaintext and performing multiple shifts

Practical Task Report: Comparison of Caesar Cipher and Vigenère Cipher

Introduction

Cryptography is the study of securing information by converting it into unreadable formats. Two basic classical encryption techniques are the Caesar Cipher and the Vigenère Cipher. Both are substitution ciphers used to understand basic encryption concepts.

Encryption Process

The Caesar Cipher works by shifting each letter in the plaintext by a fixed number of positions in the alphabet. For example, a shift of 4 changes A → E.

The Vigenère Cipher uses a keyword to determine different shift values for each letter. Each letter of the keyword defines a different Caesar shift, making the encryption more complex.

Advantages and Disadvantages

Caesar Cipher is simple and easy to implement but very weak in security.

Vigenère Cipher is more secure and harder to break, but it is more complex and still vulnerable if the keyword is short or reused.

Security Comparison

Caesar Cipher has very low security because it can be easily broken using brute force (only 25 possible shifts).

Vigenère Cipher is stronger because it uses multiple shifts, making frequency analysis more difficult, however it can still be cracked with modern cryptanalysis.

Modern Relevance

Caesar Cipher is mainly used for educational purposes only.

Vigenère Cipher is also mostly educational today, but it introduced ideas that influenced modern encryption techniques.

Conclusion

Both ciphers are important in learning cryptography basics. However, neither is secure for modern communication. Vigenère Cipher is stronger than Caesar Cipher but still not suitable for real-world security systems.

Extra Practical Task

The screenshot shows the 'Classical Cipher Studio' website. The header includes the URL '8gwifi.org' and navigation links: 'Tutorials', 'URL Shortener', 'JSON Beautifier', 'Temp Email', 'Hire Me!', and a 'Buy me a coffee' button. The main heading is 'Classical Cipher Studio' with a subtext: 'Type once – see many ciphers at a glance. Toggle Encode/Decode to switch direction.'

The interface is divided into three main sections:

- Input & Mode:** Includes a 'Decode mode' checkbox and a text input field containing 'NETWORK'.
- Parameters:** Contains settings for different ciphers:
 - Caesar Shift: 4
 - Affine A: 1
 - Affine B: 8
 - Vigenère Key: KEY
 - Scytale Columns: 5
 - Rail Fence Rails: 3
- Outputs:** Displays the results for various ciphers, each with a 'Copy' button:
 - Caesar (shift 4): RIXASVO
 - ROT5 (0–9): NETWORK
 - ROT13: ARGJBEX
 - ROT18: ARGJBEX
 - ROT47: }t% (~#z
 - Atbash: MVGDLIP
 - Affine (a=1, b=8): VMBEWZS
 - Vigenère (KEY): XIRGSPU
 - Enigma (M3): OZARWIY
 - Scytale (cols=5): NREKTWO
 - Rail Fence (rails=3): NOEWRTK

Figure 8: Research and test one free online classical cipher simulator

Week 2: Classical Cryptography and Cipher Design

Implementation of Classical Encryption Algorithms

The image shows a VS Code editor window with a file named `Caesar_Cipher_Implementation.py`. The code implements a Caesar cipher encryption. It defines a text "SECURITY" and a shift of 4. It iterates through each character in the text, and if it is an alphabetic character, it shifts its ASCII value by the specified amount, wrapping around the alphabet. The result is printed as "Encrypted: WIGYVMXC". Below the editor, the terminal shows the command to run the script using Python 3, and the output matches the printed result in the code.

```
Caesar_Cipher_Implementation.py x
home > ayub > Desktop > Caesar_Cipher_Implementation.py > ...
1  text = "SECURITY"
2  shift = 4
3
4  result = ""
5
6  for char in text:
7      if char.isalpha():
8          result += chr((ord(char) - 65 + shift) % 26 + 65)
9
10 print("Encrypted:", result)
```

```
ayub@ayub-HP-EliteBook-820-G3:~/Desktop$ /usr/bin/env /bin/python3 /home/ayub/.vscode/extensions/ms-python.debugpy-2026.6.0-linux-x64/bundled/libs/debugpy/adapter/../../debugpy/launcher 33763 -- /home/ayub/Desktop/Caesar_Cipher_Implementation.py
Encrypted: WIGYVMXC
ayub@ayub-HP-EliteBook-820-G3:~/Desktop$
```

Figure 9: Caesar Cipher Implementation

The image shows a VS Code editor window with a file named `Vigenere_Cipher.py` open. The script implements a Vigenere cipher encryption. The plaintext is "NETWORK" and the keyword is "KEY". The ciphertext generated is "XIRGSPU".

```

1  plaintext = "NETWORK"
2  keyword = "KEY"
3
4  plaintext = plaintext.upper()
5  keyword = keyword.upper()
6
7  ciphertext = ""
8  key_index = 0
9
10 for char in plaintext:
11     if char.isalpha():
12         p = ord(char) - 65
13         k = ord(keyword[key_index % len(keyword)]) - 65
14
15         c = (p + k) % 26
16         ciphertext += chr(c + 65)
17
18         key_index += 1
19     else:
20         ciphertext += char
21
22 print("Plaintext:", plaintext)
23 print("Keyword:", keyword)
24 print("Ciphertext:", ciphertext)

```

The terminal output shows the execution of the script:

```

ayub@ayub-HP-EliteBook-820-G3:~/Desktop$ /usr/bin/env /bin/python3 /home/ayub/.vscode/extensions/ms-python.debugpy-2026.6.0-linux-x64/bundled/libs/debugpy/adapter/../../debugpy/launcher 57949 -- /home/ayub/Desktop/Vigenere_Cipher.py

Figure 13: Vigenere Cipher User Interface Validation

Reflection

I learned that encryption algorithms convert readable text into ciphertext using mathematical rules and keys. Keys are important because they control the encryption and decryption process. The encryption workflow involves plaintext, a key, encryption, and decryption. I identified weaknesses in classical ciphers, including susceptibility to brute-force and frequency analysis attacks.

Practical Demonstrations

The image shows a Visual Studio Code editor window with a Python file named `random_numbers.py` open. The code in the file is as follows:

```
1 import random
2
3 print("Random Numbers:")
4 for i in range(5):
5     print(random.randint(1, 100))
```

Below the editor, the TERMINAL panel is active, showing the command used to run the script and its output:

```
ayub@ayub-HP-EliteBook-820-G3:~/Desktop$ /usr/bin/env /bin/python3 /home/ayub/.vscode/extensions/ms-python.debugpy-2026.6.0-linux-x64/bundled/libs/debugpy/adapter/../../debugpy/launcher 37499 -- /home/ayub/Desktop/random_numbers.py
Random Numbers:
6
83
5
43
36
ayub@ayub-HP-EliteBook-820-G3:~/Desktop$
```

The status bar at the bottom of the editor indicates the current line and column (Ln 5, Col 34), the file encoding (UTF-8), the line ending (LF), the language (Python), and the Python version (Python 3.12.3).

Figure 14: Python Random Numbers

The screenshot shows a VS Code editor window with a file named `LC_Generator.py` open. The code defines a Linear Congruential Generator (LCG) with parameters $a=5$, $c=3$, $m=16$, and $\text{seed}=7$. It prints the LCG sequence for the first 10 iterations. The terminal output shows the sequence of numbers generated: 6, 1, 8, 11, 10, 5, 12, 15, 14, 9.

```
1 a = 5
2 c = 3
3 m = 16
4 seed = 7
5
6 print("LCG Sequence:")
7
8 x = seed
9
10 for i in range(10):
11     x = (a * x + c) % m
12     print(x)
```

```
ayub@ayub-HP-EliteBook-820-G3:~/Desktop$ /usr/bin/env /bin/python3 /home/ayub/.vscode/extensions/ms-python.debugpy-2026.6.0-linux-x64/bundled/libs/debugpy/adapter/../../debugpy/launcher 44689 -- /home/ayub/Desktop/LC_Generator.py

Assignment 2

One-Time Pad (OTP), RC4 Stream Cipher, and Real-World Applications

Introduction

Stream ciphers encrypt data one bit or one byte at a time using a keystream. Two well-known examples are the One-Time Pad (OTP) and RC4.

One Time Pad

The One-Time Pad is an encryption technique that uses a truly random key equal in length to the message. Each character of the plaintext is combined with the corresponding key character to produce ciphertext

Advantages

Provides perfect secrecy when used correctly.

Extremely resistant to cryptanalysis.

Disadvantages

Requires a key as long as the message.

Secure key distribution is difficult.

Keys must never be reused.

RC4 Stream Cipher

RC4 is a stream cipher developed by Ron Rivest. It generates a pseudorandom keystream that is combined with plaintext using XOR operations.

Advantages

Simple and fast implementation.

Low computational requirements.

Disadvantages

Vulnerable to several cryptographic attacks.

No longer recommended for secure communications.

Real World Applications

One-Time Pads have historically been used for highly sensitive military and diplomatic communications. RC4 was widely used in wireless security protocols and internet communications but has largely been replaced by more secure algorithms such as AES-based encryption.

Conclusion

OTP offers theoretically perfect security but is impractical for most applications. RC4 was efficient and popular but is now considered insecure. Modern systems rely on stronger cryptographic algorithms that provide both security and practicality.

Advanced Practice Tasks

Task 1

```
home > ayub > Desktop > XOR_Modified.py > message
1 message = input("Enter message: ")
2 key = int(input("Enter key (0-255): "))
3
4 encrypted = []
5
6 for char in message:
7     encrypted.append(ord(char) ^ key)
8
9 print("\nEncrypted Data:")
10 print(encrypted)
11
12 decrypted = ""
13
14 for value in encrypted:
15     decrypted += chr(value ^ key)
16
17 print("\nDecrypted Message:")
18 print(decrypted)
```

```
ayub@ayub-HP-EliteBook-820-G3:~/Desktop$ /usr/bin/env /bin/python3 /home/ayub/.vscode/extensions/ms-python.debugpy-2026.6.0-linux-x64/bundled/Libs/debugpy/adapter/../../debugpy/launcher 60469 -- /home/ayub/Desktop/XOR_Modified.py
Enter message: My Name Jeff
Enter key (0-255): 55

Encrypted Data:
[122, 78, 23, 121, 86, 90, 82, 23, 125, 82, 81, 81]

Decrypted Message:
My Name Jeff
ayub@ayub-HP-EliteBook-820-G3:~/Desktop$
```

Figure 19: Modified XOR Cipher

Task 2

```
home > ayub > Desktop > Menu_Stream_Cipher.py > ...
1 while True:
2     print("\n STREAM CIPHER MENU ")
3     print("1. Encrypt Message")
4     print("2. Exit")
5
6     choice = input("Enter choice: ")
7
8     if choice == "1":
9         message = input("Enter message: ")
10        key = int(input("Enter key (0-255): "))
11
12        encrypted = []
13
14        for char in message:

Figure 20: Menu Driven Stream Cipher Application

Task 3

	True Random Generators	Pseudorandom Generators
Security	Higher security. Values come from physical randomness.	Lower security if algorithm or seed becomes known.
Speed	Generally slower due to physical measurement processes.	Very fast, suitable for large scale applications.
Cost	More expensive because special hardware is often required.	Cheaper because only software algorithms are needed.
Practicality	Less practical for everyday computing.	Highly practical ,widely used in software systems.
